

MOTION DETECTION

OxBlue's Sapphire camera series features upgraded motion detection capabilities, alerting you to unwanted night time activity – at no additional cost. While not a complete security system, the Sapphire camera helps add another layer of protection so you can keep track of what happens on your site after hours.

LOWERED LIFT BOOM

VEHICLE MOVEMENT

CUSTOMIZABLE SETTINGS

- Choose your monitoring hours and days
- Set a sleep timer between alerts
- Define your observation area
- Enable motion detection on your own terms

AFTER HOURS ALERTS

- Immediate and automatic email notifications
- Brief video clips so you can quickly determine the risk level
- Full recordings to use as additional documentation for the authorities

HOW IT WORKS

All Sapphire cameras with Motion Detection enabled will be streaming and recording at 1080p. Motion is detected through the monitoring of significant pixel movement. When a high threshold of pixels change, it triggers an alert sending you a video file (usually 30 seconds) by email. Using OxBlue Recorded Video, you can select specific timestamps to pull full footage surrounding the event for review.

Motion Detection works better the closer the camera is to a project. OxBlue adjusts camera sensitivity settings to try to find the right balance for each site but if the camera is at a great distance, it is less likely to capture movement and more susceptible to false alerts. Ample lighting is recommended for best results.
